NAFLD encompasses a spectrum of increasingly severe clinicopathological conditions ranging from fatty liver to steatohepatitis (NASH) with or without hepatic fibrosis/cirrhosis.

This condition is largely due to excessive consumption of saturated fats and simple sugars [,], which, associated with sedentarism, represent the modern lifestyle [].. Sixty Wistar rats were randomly separated into experimental and control groups, which were fed with sucrose-enriched (18% simple carbohydrates) and standard diet, respectively.. These compounds generate a variety of cellular stimulations with subsequent inflammatory response, which has been recognized as the causal factor of NASH/fibrosis (second causative step) [,].. In conclusion, a sucrose-rich diet induced obesity, insulin resistance, oxidative stress, and NAFLD in rats.. Recent evidence suggests that NAFLD is also associated with cardiovascular and chronic kidney disease [] and increased risk of hepatocellular carcinoma [–].. Manual De Cardiologia VeterinariaThe pathogenesis of nonalcoholic fatty liver disease (NAFLD) is not fully understood, and experimental models are an alternative to study this issue.. Manual De Cardiologia Veterinaria Pdf Editor Manual amir neurologia y neurocirugia - SlideShare.. Manual De Cardiologia VeterinariaObesity is recognized as a risk factor for many disorders including type-2 diabetes and nonalcoholic fatty liver disease (NAFLD).. It has been considered that insulin resistance and hyperinsulinemia play a key role in the pathogenesis of NALFD (first causative step).. From weeks 25 to 30, 6 animals from each group underwent physical training The experimental group animals developed obesity and NAFLD, characterized histopathologically by steatosis and hepatocellular ballooning, clinically by increased thoracic circumference and body mass index associated with hyperleptinemia, and metabolically by hyperglycemia, hyperinsulinemia, hypertriglyceridemia, increased levels of very low-density lipoprotein- (VLDL-) cholesterol, depletion of the antioxidants liver enzymes superoxide dismutase and catalase, and increased hepatic levels of malondialdehyde, an oxidative stress marker.. In spite of growing knowledge, several aspects of NAFLD pathogenesis are still unknown.. Rats that underwent physical training showed increased high-density lipoprotein- (HDL-) cholesterol levels. b0d43de27c Rsa For Mac
